

# Towards smarter public transport

Sensing, Modeling and Visualizing Urban Mobility and Copresence Networks

---

Vassilis Kostakos

*16 September 2010, Bogota, Colombia*

# Motivation

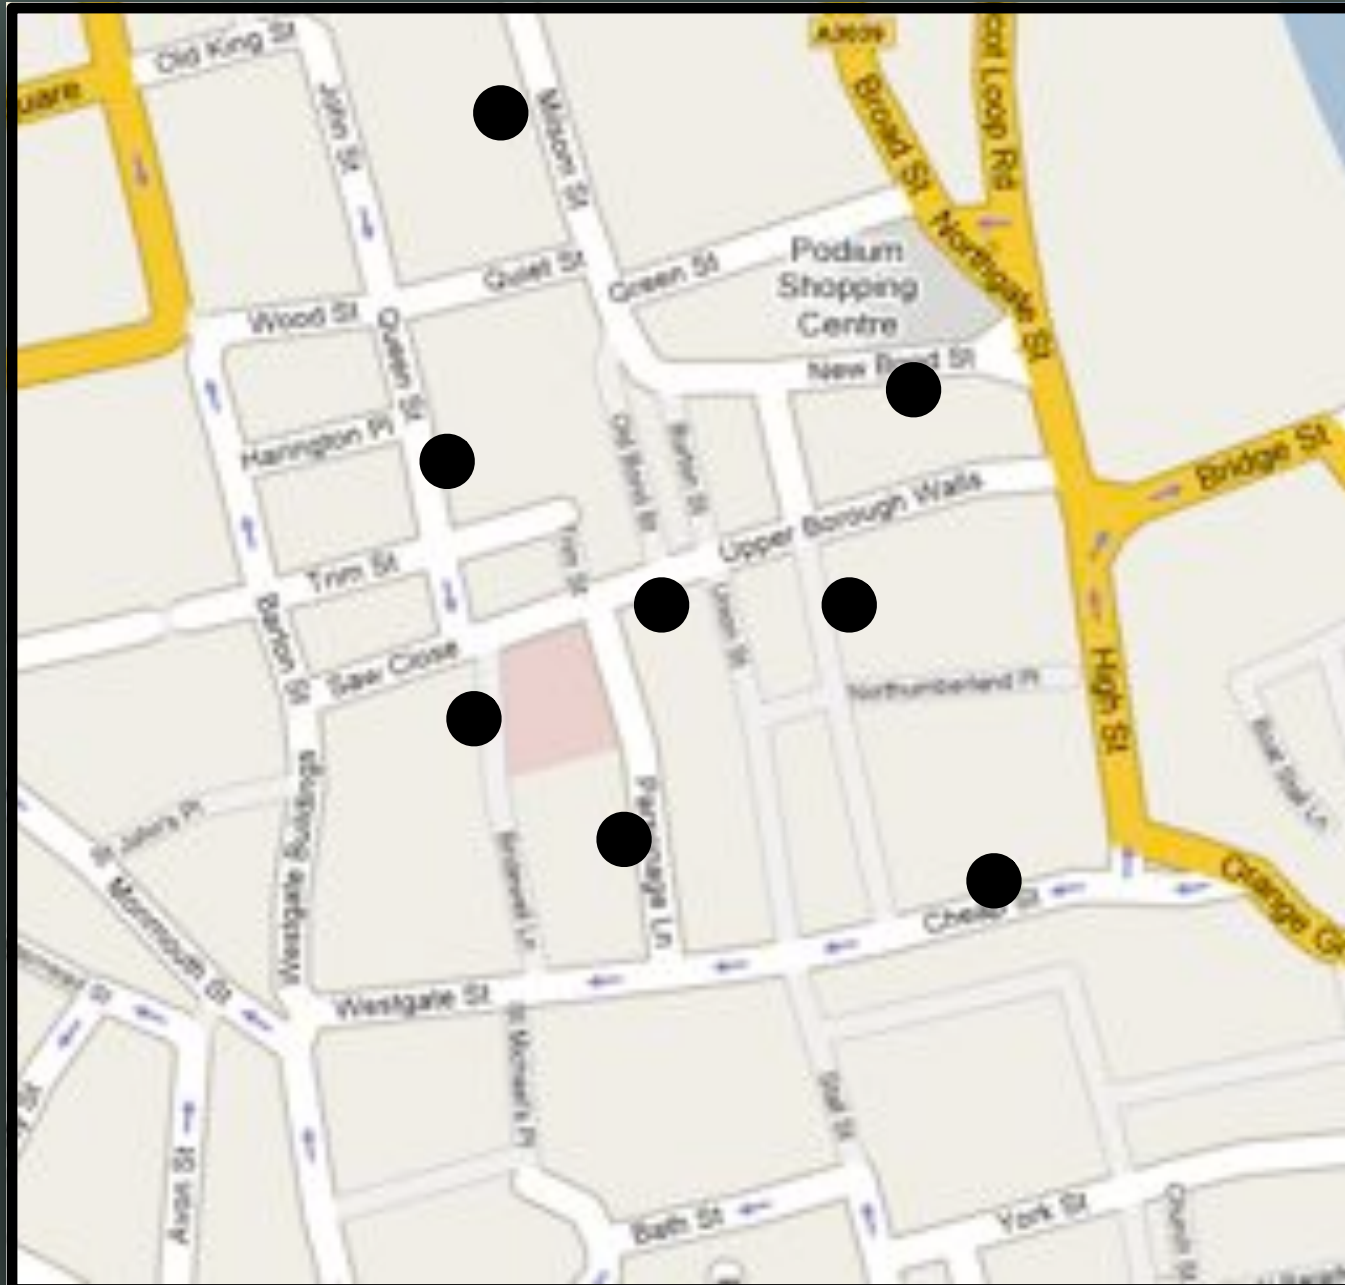

- People increasingly carry mobile communication technologies
- By taking advantage of technology that **passengers** carry
  - Better understanding of passenger behaviour
  - Increase bus seat occupation
    - Optimise network
    - Provide passengers with better information services

# Outline

- Describe the enabling technology & algorithms
- Applications
  - End-to-end passenger counting
  - Contextual services

# Exploiting people's phones to collect mobility data

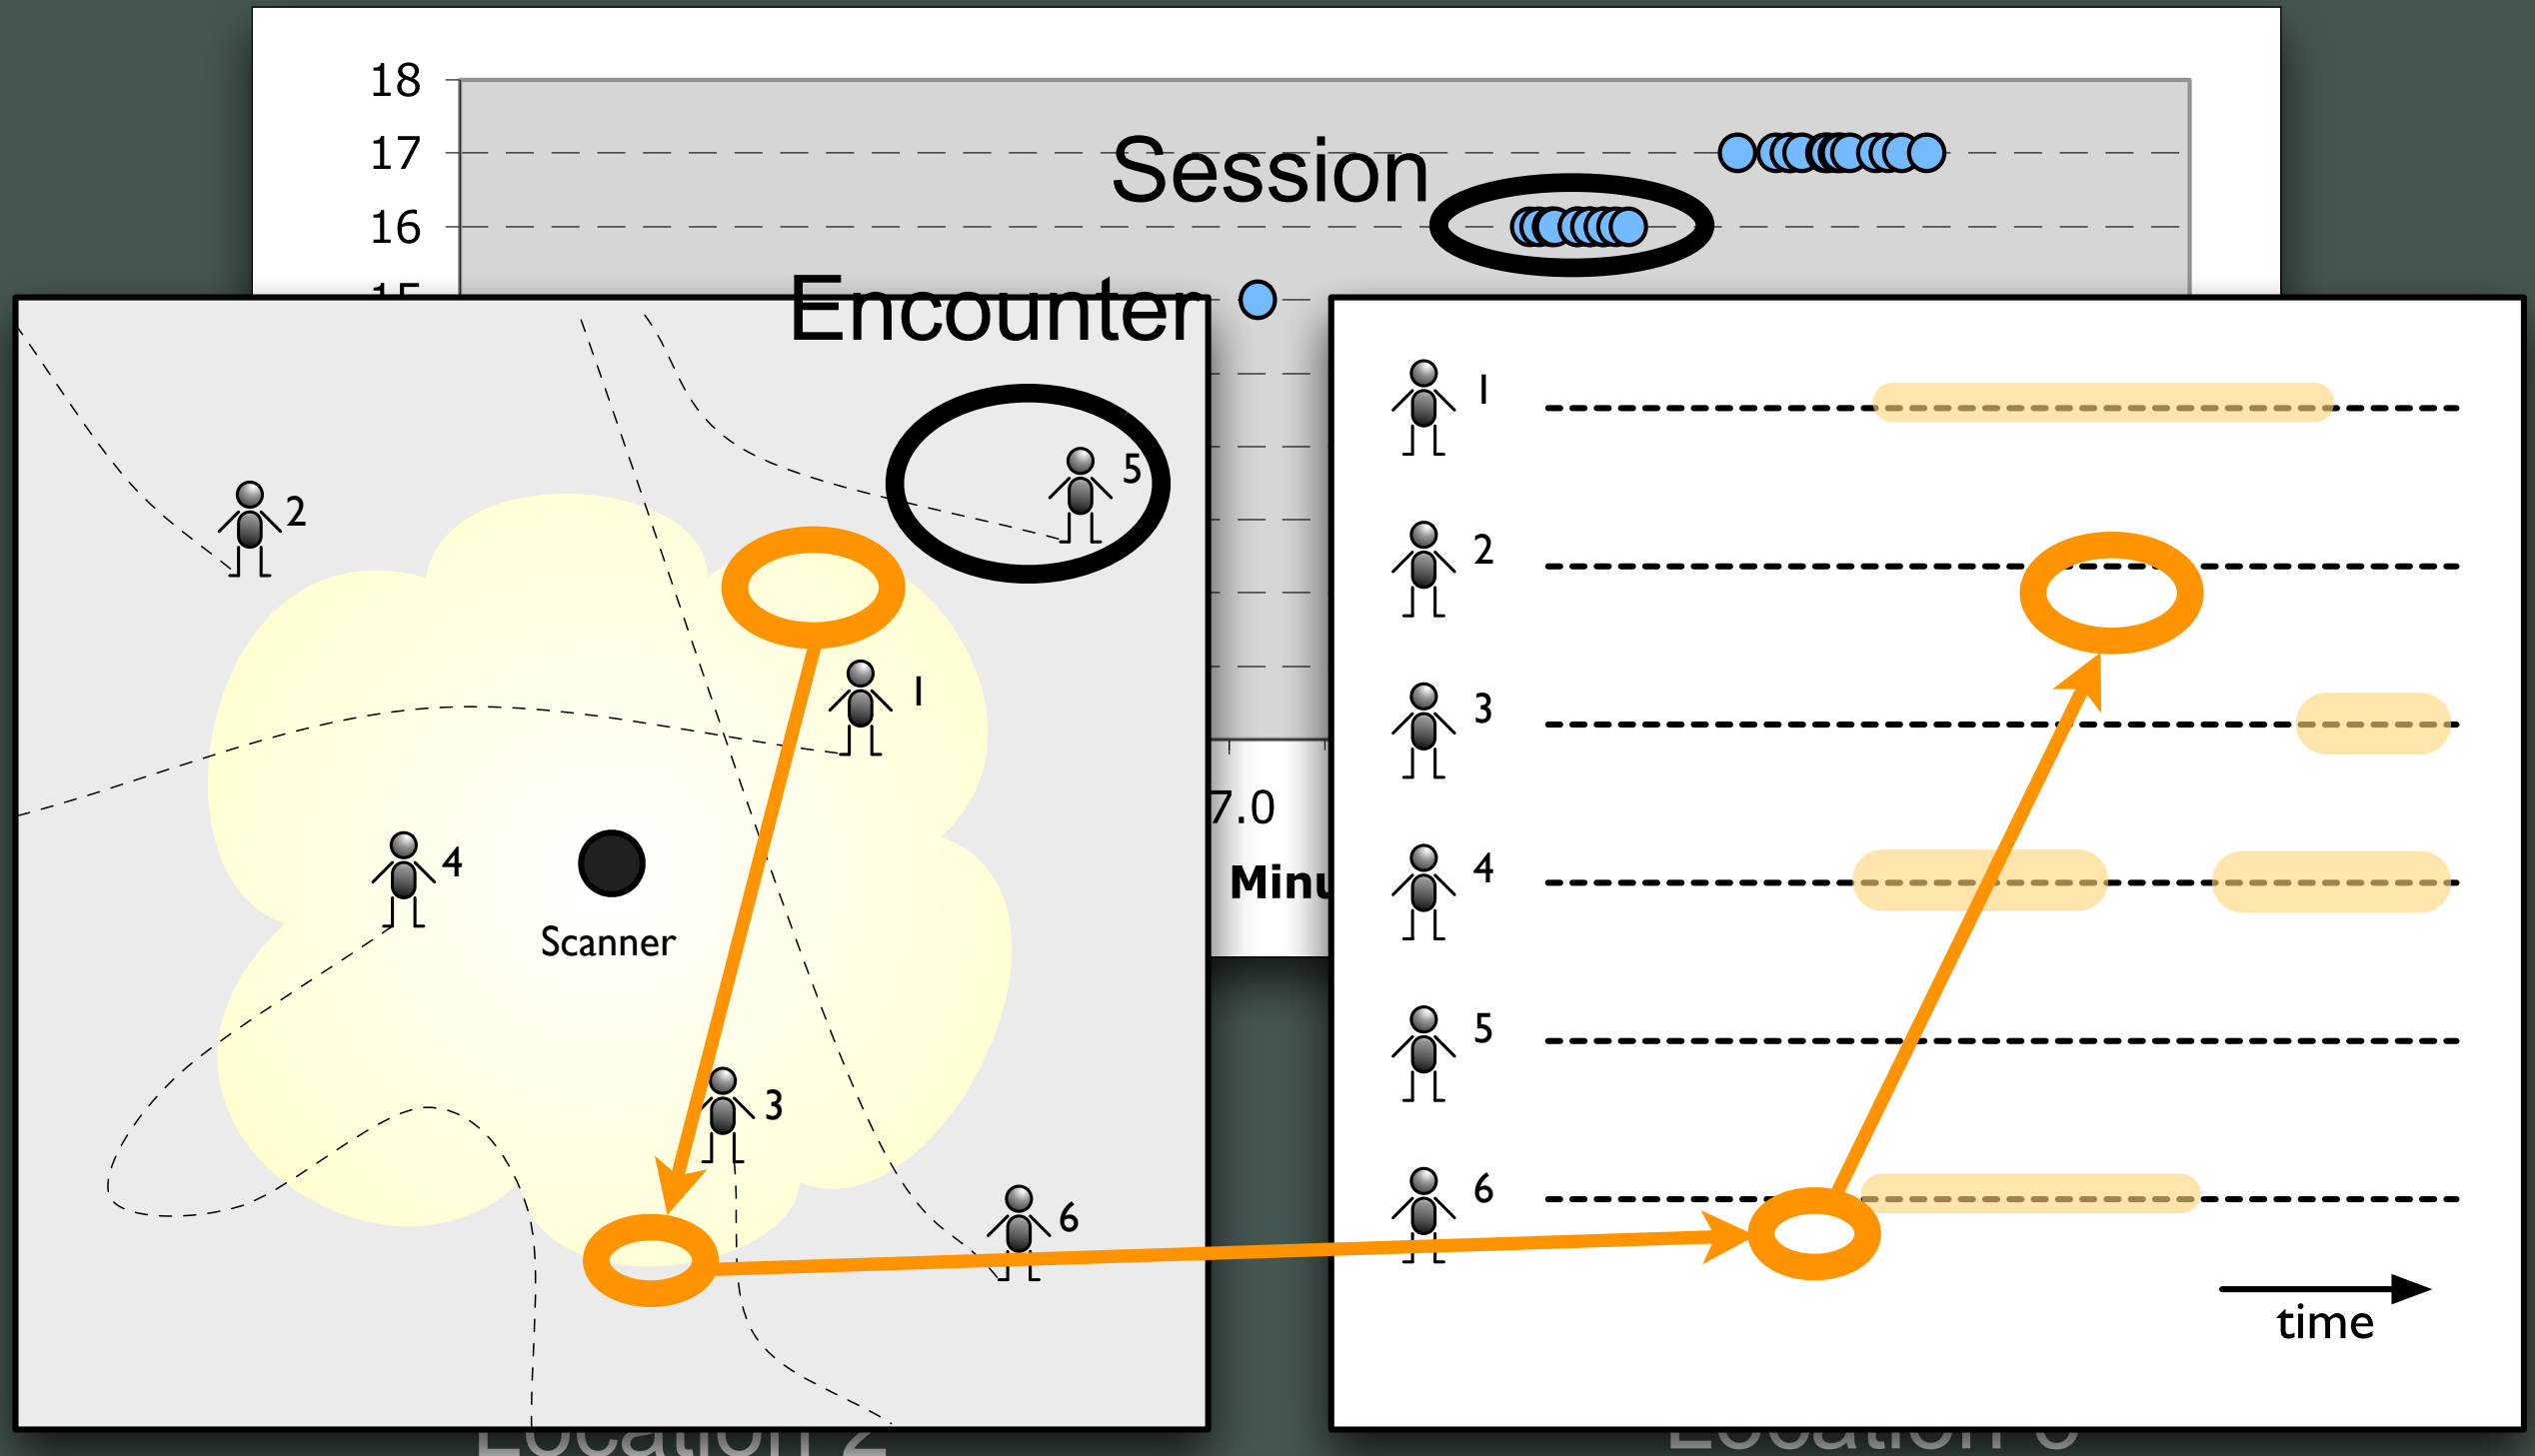

# Main concepts

- Sessions
- Trails
- Encounters

# Location 1

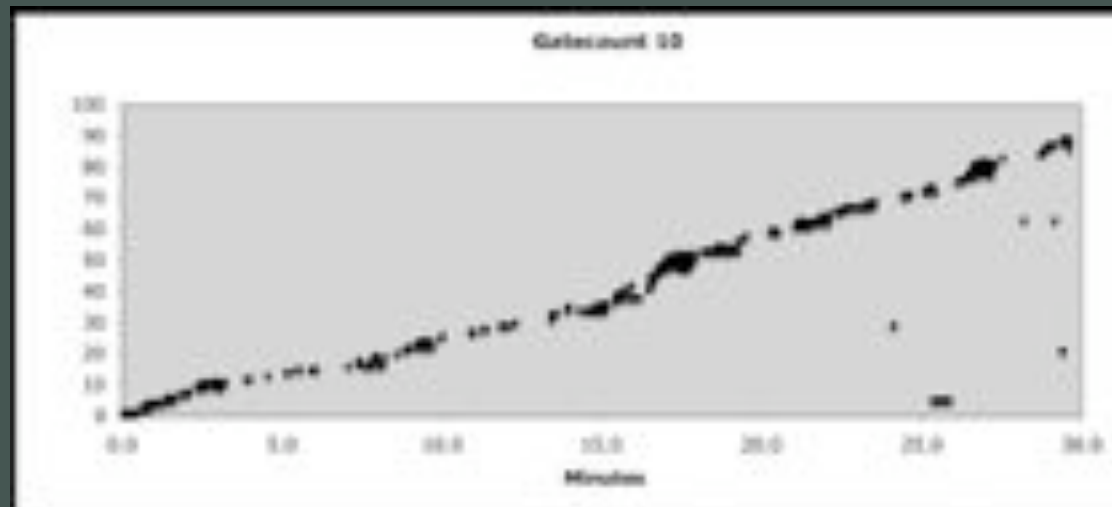

Mobile Gatecount 1

# Flow of people

## Avenida - Recovery

# End-to-end passenger detection on busses

# Deployment

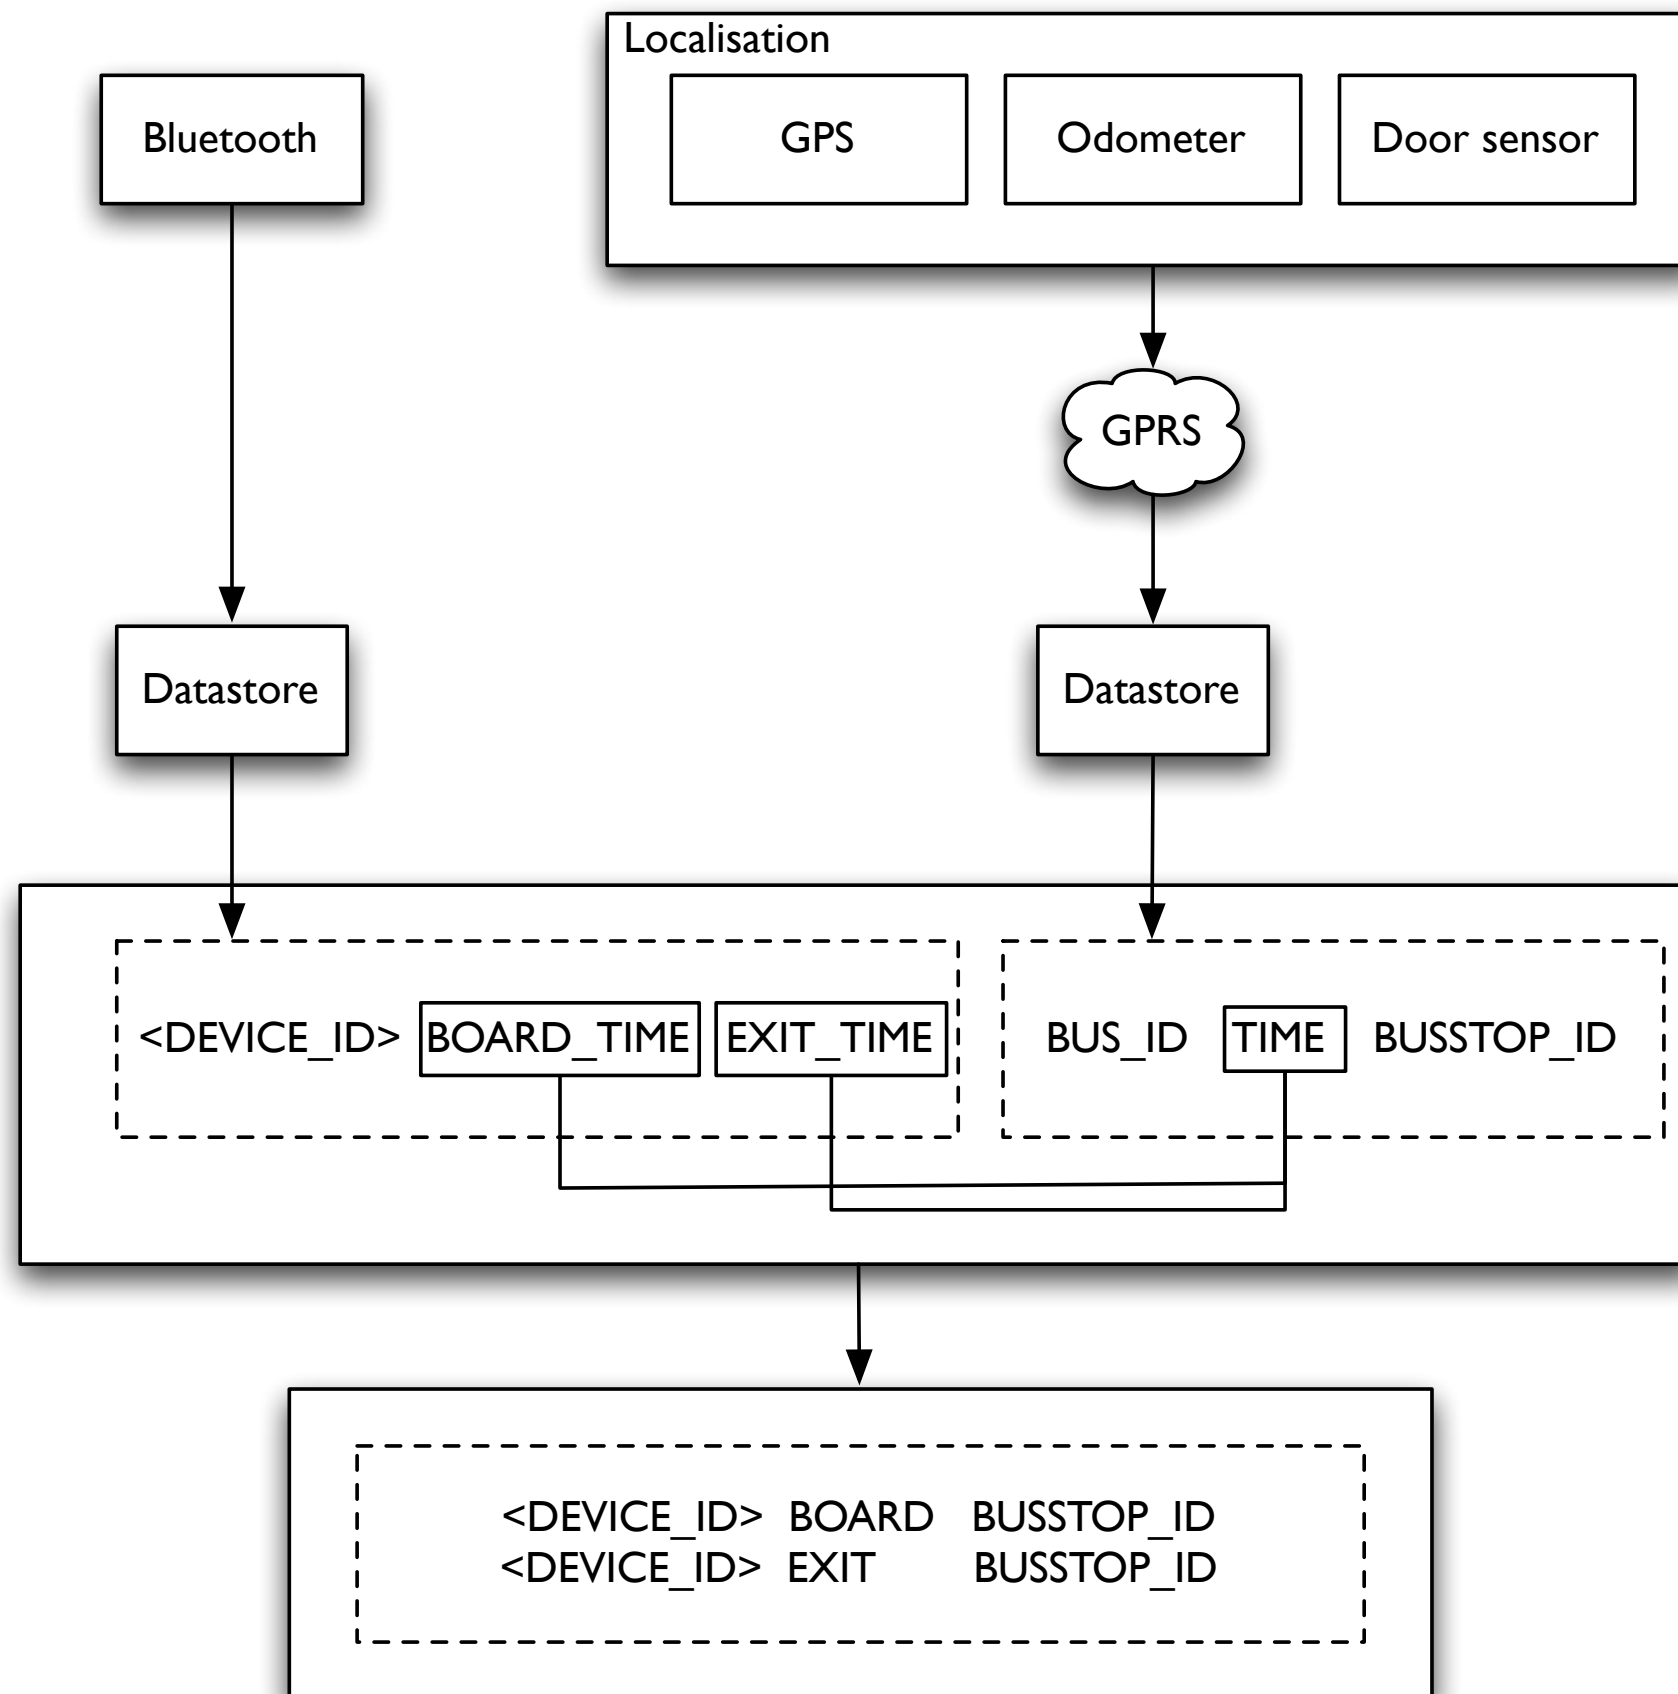

- Install the equipment onboard a bus
- Integrate with Automated Vehicle Location data

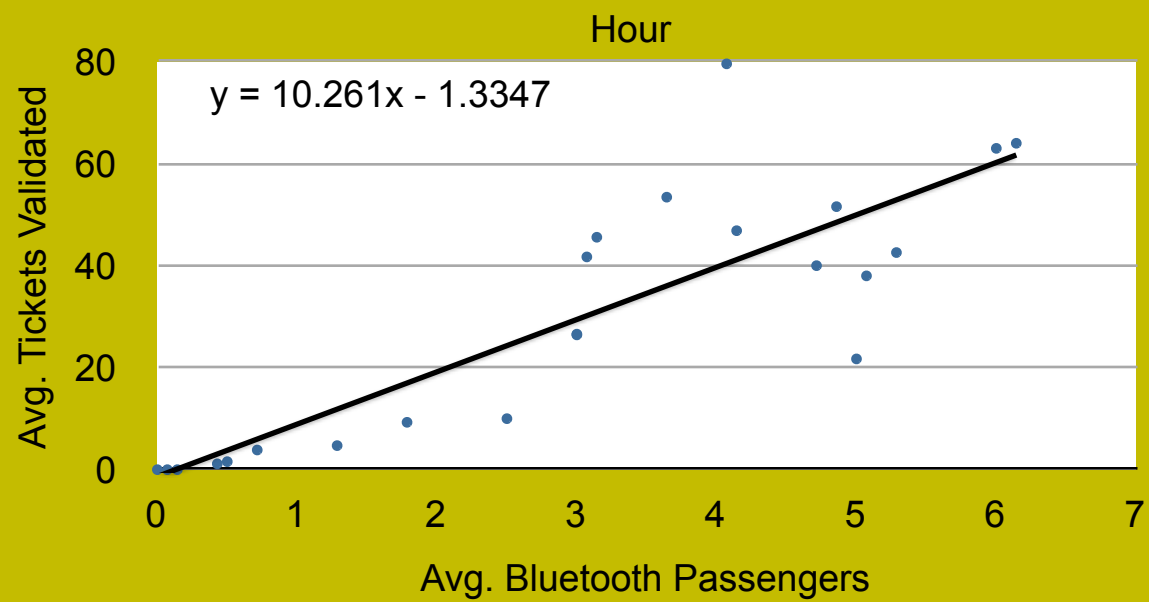

# Results

- Identification of entry and exit points for individual devices
- Estimations suggest 10% of population have Bluetooth in discoverable mode
- System was deployed at a single bus for 4 weeks
- Bus covered 4 different routes at different times of day

# Contextual services for passengers

# Proposed route

- Installation of 12 stations at/nearby public transit bus stops. Deployment at strategic locations

# Proposed system

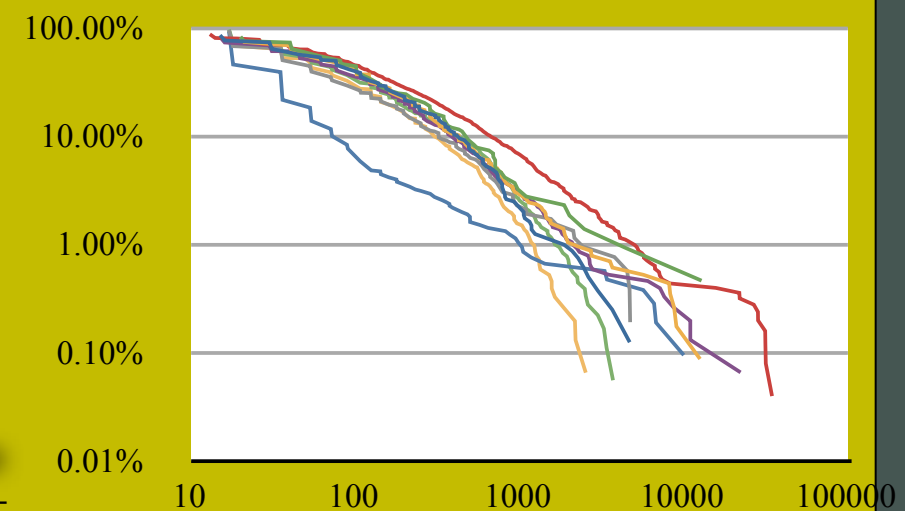

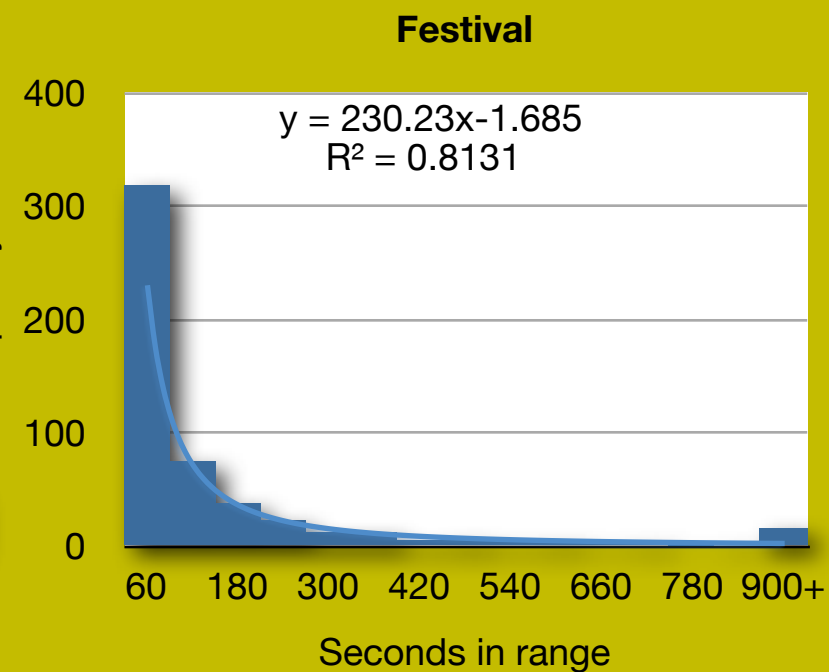

- Deploy equipment to collect data and provide services at bus stops
- Information is routed to the central server
- Provide both historical and (near) real-time perspective

# Service triggering

- Services are triggered when a device is detected
- Parameters / filters of a service
  - What to send (URL? Local file?)
  - To whom to send? (Specific device, broadcast)
  - At which location(s)?
  - At what time/date?
  - ...

— Successful Deliveries  
■ Total Attempts

# Results

- Many passengers did not successfully receive the test file
  - We did not advertise the service!
  - People don't realise that their phone is trying to receive a file
  - Advertisement & increased awareness should resolve this
- New capabilities open up
  - Reward scheme based on how much time you wait
  - Personalised O/D matrix, predictions, better info

# Summary

- By exploiting passengers' mobile bluetooth-capable phones we can
  - Collect rich data about travel behaviour
  - Provide rich, context-aware services
- The collected data are much richer than what current techniques can capture
- The provided services can be fully personalised

# The end

- Thank you!
